Analysis of AI Usecases in HealthCare and Agriculture:

HealthCare: For healthcare, AI has a great number of uses, a few recent advances that have seen use in the medical field or a possible recent development to be used in the field for a example is the ability to find cancer cells or deadly viruses within the bloodstream of patients. Then have the AI scan the cancer cells/infected cells and create a possible cure for their specific problem within or near 24-48 hours. This isnt the only use of AI in healthcare though, apart from being used for medical purposes, AI is greatly used in healthcare for things such a documentation, files/filling, appointments and more. This is used to usually speed up and make the process of healthcare more simple for doctors and patients alike.

Agriculture: For Argiculture we have a few new AI usecases being used currently and spark future interest in future possibilities of AI uses in Farmland. For example Jacqueline Heard, CEO and co-founder of Enko Chem stated by AP news said their company has developed with Ai something called “Precision agriculture” where AI would be used to detect disease with in crops, optomize pesticide use and much more surrounding on specifically containing and finding issues surrounding crops rather then spraying the entire crop and land wasting resources and destroying the environment. She speculates in the near future AI will be used to analyze soil and find the

best places or worst places to have crops. Increasing yield of crops and decreasing bad or diseased crops.
