Artificial Intel Applications

30 January 2025

A04 Mod 04 ClassNotes

The main discussion point of the class, was talking about the effects of AI, on the economy and public around us. Each advancement bringing in its fair share of ups and downs. While advancements may seem beneficial to humans, there will always be more to such advancements. A main topic of this subject was how AI and current technology is used for numerous amounts of scams to manipulate poor or uneducated citizens to giving away important information that can be used. A example of this is digital police scams used to impersonate the FBI to get critical bank information to take money from victims. Scams like these bring up skepticism on new technology that are created by unreliable sources or open source. Such as Deepsea, which may seem a very good step into advancing AI, but due to in unreliable background it brings skepticism on how it may be, being used behind closed doors. We learned in class certain ways we can use such risky software without harming ourself and how to look out for such risks to decrease the possibility of being manipulated.
